The Malaysian Tin Bulletin is published by the Secretary of the Tin Industry (Research and Development) Board, Ministry of Natural Resources, Environment and Climate Change. The Bulletin is prepared from information obtained from official or other sources believed to be reliable and accurate. The Tin Board, however, cannot accept any liability for any error or omission therein.

SEPTEMBER TIN MARKET REVIEW

London Metal Exchange (LME)

Unsure of its next direction as market sentiment remained largely uncertain, tin trading on the LME during the month of September was mostly volatile and range bound between US\$24,200 to US\$26,420 per tonne. Trading movement of other base metals again impacted tin trading on the LME during the month.

The market started the September trading month at US\$25,600 per tonne for cash tin and US\$25,800 per tonne for 3-month tin. It was the only trading day of the short first trading week.

Buoyed by strong demand, the tin price rose during the early days of the second trading week to reach the month's highest price level for cash and 3-month tin at US\$26,400 and US\$26,420 per tonne, respectively on 5th September. Trading, however, went the opposite direction due to heavy selling as traders took advantage of the earlier higher prices to end the trading week lower.

The tin price softened further during the first half of the third trading week before rebounding afterwards and somewhat checked by a technical correction at end of the trading week.

The fourth trading week saw the tin price being traded range bound resulting from uncertain sentiment.

The market inched-up going into the final trading week. However, a major correction came immediately thereafter that caused the tin price to plunge towards end of the trading week to close the September trading month at US\$24,200 and US\$24,450 per tonne for cash and 3-month tin, both being their respective lowest price level for the month.

The average price for LME cash and 3-month tin for the September month were US\$25,559 and US\$25,767 per tonne, respectively.

NEW HIGHLIGHT

MSC Wins Highest Profit Growth Award

Malaysia Smelting Corporation Bhd (MSC), a 52 per cent-tin mining and smelting subsidiary of The Straits Trading Co Ltd, is poised to scale new heights. It was named a joint winner of the "Highest Growth in Profit After Tax Over Three Years" category in the industrial products and services sector at a recent corporate awards.

The accolade acknowledges companies that have not only been profitable, but also shown a consistent pattern of profit growth throughout an evaluation period from 2020 to 2022.

MSC's success over the past few years, despite the adverse operating climate, deserved to be recognised, said Straits Trading executive chairman Chew Gek Khim.

"Straits Trading will continue to support MSC to achieve greater success ahead," said Chew, who is also MSC chairman. MSC, which is listed on both Bursa Malaysia and the Singapore Exchange, enjoys a reputation as the world's leading customs smelter.

NEWS ROUND-UP

Eloro Resources Announced Maiden Mineral Resource Estimate

Eloro Resources has announced its maiden Mineral Resource Estimate (MRE) for the Iska-Iska silver-tin project in southern Bolivia following comprehensive drilling and metallurgical testing.

The MRE, compliant with NI 43-101 standards, identifies two principal mineralisation zones, namely the deeper Tin Domain to the west and the shallower Zn-Pb-Ag Polymetallic Domain to the east. The Tin Domain hosts 110 million tonnes at 0.12 per cent Sn, equating to 130,000 tonnes of contained tin in the inferred category. This domain also contains lead and silver at 0.14 per cent and 14.2 g Ag/t, respectively.

The Polymetallic Domain is much larger, hosting 560 million tonnes in the inferred category and Zn-Pb-Ag grades at 0.73 per cent, 0.28 per cent, and 13.8 g/t, respectively. The majority of both domains are potentially open-pittable, which would result in a pit 1.4 km in diameter with a stripping ratio of 1:1. The resource remains open in all directions.

The company's spokesman said "We are delighted with this initial MRE, which shows what a massive discovery Iska Iska

is." Surpassing 500 million tonnes, this resource now aligns with the 'giant' systems of the Bolivian Tin Belt, comparable to the likes of Cerro Rico de Potosí and Llallagua.

The spokesman added "The recent metallurgy, particularly the positive 'ore sorting' results, has significantly enhanced the potential economics." As each domain concentrates mineralisation in vein breccias, ore-sorting could have a significant impact by selectively removing waste material, thereby reducing operating costs and increasing feed grades into the grinding circuit.

Eloro's geological team hopes that the resource can be expanded further, with grades from wide-spaced drilling likely increasing following definition drilling. This is particularly significant for the Tin Domain, which has been historically under-drilled, with indications of a large porphyry at depth.

The company plans to start the next phase of work, which includes definition drilling, further metallurgical testing, preparation of a preliminary economic assessment (PEA), and additional drilling of the tin domain.

Stellar Increasingly Confident of Heemskirk Tin project

Stellar Resources Limited has continued to increase confidence at its flagship Heemskirk Tin Project, following an Updated Mineral Resource Estimate (MRE).

Heemskirk is formed of several tin deposits. Severn, which is the largest, has seen significant drilling over the last few years. The drilling comes in a series of phases, namely Phase 1, Phase 2A and Phase 2B. The aim of the drilling is to increase confidence in mineralisation at Severn through upgrading material from the Inferred category to the Indicated category. An update to the MRE, which took into account results from the first two phases, was released late last year.

The latest update incorporates results from the final phase of drilling. This phase consisted of nine drill holes targeting wide high-grade areas of the deposit. The reduced drill spacing

has boosted confidence. Now, the Indicated category at Severn's holds 2.33 million tonnes at 0.96 per cent Sn for 22,500 tonnes contained tin, an increase of 30 per cent in contained tin compared to last year's update.

While Severn sees an increase, there are minor tweaks in the MRE from the smaller deposits at Heemskirk. At the Queen Hill deposit, an alignment of geological interpretation increased its contained tin slightly. Conversely, the decision to exclude the Oonah deposit from the resource due to its high stannite levels and poor drilling results, has reduced the Total Mineral Resource's tin content by 5 per cent.

Stellar Resources plans to use the increased Indicated Mineral Resource to support a Pre-Feasibility Study on the project, scheduled for later this year.

First Tin's Taronga Tin Project Doubled its Resource

First Tin has more than doubled the size of its resource in an updated Mineral Resource Estimate (MRE) released for its Taronga Tin Project in Australia. The company has also released the results from its mineral processing test work, identifying a path to produce a cheap, saleable concentrate.

First Tin acquired the Taronga Tin Project from Aus Tin Mining in 2021. Since then, it has carried out an expansive and confirmatory drill campaign to upgrade its resource which was last updated in 2014 by its former owners. The company's spokesman said "The 2023 MRE represents the culmination of a highly successful drill campaign at Taronga, which opened up new areas of mineralisation and validated previous data."

The new resource now includes 133 million tonnes at 0.1 per cent Sn for 138,100 tonnes contained tin using a 0.05 per cent Sn cut-off grade. This is a substantial increase of 240 per cent from the previous MRE. Much of this increase is attributed to a decrease in cut-off grade from 0.10 per cent Sn, hav-

ing incorporated revised economic considerations. Despite this, a direct comparison using the same cut-off grades shows a 40 per cent increase in contained tin.

The confidence in the resource has also improved, with 44,200 tonnes of contained tin being added to the Measured Resource for the first time. It shows a 36.5 per cent increase in material within the Measured and Indicated categories compared with the 2014 resource.

In a separate announcement, First Tin released results of end-to-end mineral processing test work which shows it can produce a 56 per cent, low impurity concentrate using simple coarse gravity techniques. The company will use this coarse circuit for the Definitive Feasibility Study (DFS) which it hopes to release during the first quarter of 2024. An additional 5 to 6 per cent recovery is possible from a fine tin circuit, which is being investigated for future optimisation studies.

* : The figures include high-grade tin (99.9% Sn) imported for consumption.

n.y.a : not yet available

Note : Domestic consumption of tin metal refers to the use of tin in a particular application.

Sales to manufacturing industries have been used as proxy for consumption except in the case of manufacture of tinplate which are actual tin consumption data.
